

## A DEGREE ONE BORSUK-ULAM THEOREM

DANNY CALEGARI

ABSTRACT. We generalize the Borsuk-Ulam theorem for maps  $M^n \rightarrow \mathbb{R}^n$ .

Everyone knows the Borsuk-Ulam theorem as a simple application of some of the first ideas one encounters in algebraic topology.

**Theorem 0.1** (Borsuk-Ulam). *Let  $f : S^n \rightarrow \mathbb{R}^n$  be any continuous map. Then there are antipodal points in  $S^n$  which are mapped to the same point under  $f$ .*

The purpose of this brief note is to observe that there is an easy generalization of this theorem for maps  $f : M^n \rightarrow \mathbb{R}^n$  where  $M^n$  is a closed  $n$ -manifold.

**Theorem 0.2.** *Let  $M$  be a closed  $n$ -manifold. Let  $f : M \rightarrow \mathbb{R}^n$  be any continuous map and  $g : M \rightarrow S^n$  a degree one map. Then there are points  $p, q \in M$  such that  $f(p) = f(q)$  and  $g(p) = -g(q)$ .*

*Proof:* We wiggle  $g$  to be smooth and generic. By compactness of the space of antipodal points in  $S^n$ , it suffices to prove the theorem in this case, since then we can extract a subsequence of pairs of points in  $M$  with the desired properties for a sequence of degree one smooth maps  $g_i : M \rightarrow S^n$  approximating  $g$ .

We define the following spaces

$$\hat{M} \subset M \times M - \Delta = \{(p, q) : g(p) = -g(q)\}$$

$$S \subset S^n \times S^n - \Delta = \{(p, q) : p = -q\}$$

Observe that  $S$  is homeomorphic to  $S^n$ . There is an induced map  $\hat{g} : \hat{M} \rightarrow S$  given by  $\hat{g} : (p, q) \rightarrow (g(p), g(q))$ . Since  $g$  was degree one, one easily observes that there are an odd number of points in the generic fiber of  $\hat{g}$  so that there is some connected component of  $\hat{M}$  for which the restricted map  $\hat{g}$  has odd degree. Moreover, the  $\mathbb{Z}/2\mathbb{Z}$  action on  $\hat{M}$  and  $S$  given by interchanging the co-ordinates commutes with  $\hat{g}$ , so there is an induced map on the quotients. We define  $N = \hat{M}/\sim$  and call the quotient map  $h : N \rightarrow \mathbb{R}P^n$ .

Assume on the contrary that points in  $M$  mapping to antipodal points in  $S^n$  map to distinct points in  $\mathbb{R}^n$ . Then there is a map

$$\hat{f} : \hat{M} \rightarrow S^{n-1}$$

defined by

$$\hat{f} : (p, q) \rightarrow \frac{f(p) - f(q)}{\|f(p) - f(q)\|}$$

It is obvious that this descends to a map  $j : N \rightarrow \mathbb{R}P^{n-1}$  where  $\mathbb{R}P^{n-1}$  is obtained from  $S^n$  by quotienting out by the antipodal map.

In the sequel, we consider homology and cohomology with  $\mathbb{Z}/2\mathbb{Z}$  coefficients. For simplicity of notation, we omit the coefficients.

Since the degree of  $h$  is odd,  $h^*$  pulls back the generator  $[\mathbb{R}P^n]$  of  $H^n(\mathbb{R}P^n)$  to the generator  $[N]$  of  $H^n(N)$ . Furthermore, if  $\alpha$  generates  $H^1(\mathbb{R}P^n)$  then  $h^*\alpha \in H^1(N)$  is an element whose  $n$ th power is  $[N]$ . Moreover by construction for every cycle  $C \in H_1(N)$  we have  $h_*C \neq 0$  in  $H_1(\mathbb{R}P^n)$  iff  $j_*C \neq 0$  in  $H_1(\mathbb{R}P^{n-1})$ , since these are exactly the  $C$  which do not lift to  $\hat{M}$ .

It follows that if  $\beta$  denotes the generator of  $H^1(\mathbb{R}P^{n-1})$  then  $j^*\beta(C) = h^*\alpha(C)$  for all  $C$ , and therefore  $j^*\beta = h^*\alpha$  so that the  $n$ th power of  $j^*\beta$  is nontrivial. But  $(j^*\beta)^n = j^*(\beta^n)$  which is trivial, giving us a contradiction.  $\square$

*Remark 0.1.* Notice that the proof works in exactly the same way if  $g : M \rightarrow S^n$  is a map of odd degree.

The following corollary led the author to observe the theorem above:

**Corollary 0.3.** *Let  $M^n \subset \mathbb{R}^{n+1}$  be an embedded submanifold bounding a closed region which contains a ball of diameter  $t$ . Let  $f : M^n \rightarrow \mathbb{R}^n$  be a continuous map. Then there are points in  $M$  at distance at least  $t$  apart from each other which have the same image under  $f$ .*

*Proof:* Let  $g$  be the map which is radial projection of  $M$  onto the boundary of the ball of diameter  $t$ .  $\square$
